Evolution and Anatomy of Computer

Computer:- Machine to use to do tasks & work faster than humans.

Evaluation of Computer

Early days of computer era was very large in size and design it for specific purpose for ex:- calculation computer etc. after evolving the computarization then will comes to a General purpose Computer

General purpose computer

-> Designed for multiple tasks ex calculation, programming, industry relevant etc

How Computer Works

there is name called CPU central processing Unit it is a brain of every computer

CPU has Mother board: that is connected to all hardware parts

processor :- process the tasks and kill the tasks

RAM :- Random Acess Memory (temporary)

ROM:- Read Only Memory (permanant storage)

I/O ports:- to take input and display

the information

Graphics card:- user interactive performance
based work.
used to in AI/ML

computer knows only, 0,1 binary
values that called bit

So many types of Bit based system

x32 X64 x86

~~x32~~
Android + Mini computer
It has same module of computer
Architecture with touch screen.

Raspery Pc

Raspbery Pi
Small mother board it looks
like a credit card structure
use to do a tasks , processes. same as
mother boards.
